Global Industry Standard on Tailings Management

GISTM tailings facility disclosure information for Tom Price – TSF2A

5 August 2023

Guidance on interpretation of this GISTM tailings facility disclosure:

The following provides the information required under Requirement 15.1.B of the GISTM.

The information provided in this Global Industry Standard on Tailings Management (GISTM) tailings facility disclosure should be read in conjunction with the information relating to Rio Tinto’s approach to tailings management that is available on the Rio Tinto website, and the Group-level tailings management information supporting the GISTM tailings facility disclosures that is included in the Appendix to this document.

Where Rio Tinto considers a Rio Tinto internal process, standard, procedure and/or plan gives rise to a materially similar outcome to a requirement of GISTM, Rio Tinto has adopted the relevant defined term from GISTM for the purpose of reporting under Requirement 15.1.B of GISTM, even though the relevant Rio Tinto process may have a different name or achieve a materially similar outcome by different methods.

The information provided in this disclosure contains forward-looking statements (within the meaning of the US Private Securities Litigation Reform Act of 1995) concerning the financial condition, operations and businesses of Rio Tinto. All statements other than statements of historical fact are, or may be deemed to be, forward-looking statements.

Readers should not place undue reliance on these forward-looking statements, including with regard to future investment decisions. This is because forward-looking statements are statements of future expectations that are based on management’s current expectations and assumptions and involve known and unknown risks and uncertainties that could cause actual results, performance of, or events affecting Rio Tinto, or the industry, to differ materially from those expressed or implied in these statements.

Refer to the end of this GISTM tailings facility disclosure for further information on the content of this document and on forward-looking statements.

**GISTM conformance status**

**Tailings facility name:** Tom Price – TSF2A

**GISTM consequence classification:** Very High

**GISTM conformance status:** Partially Meets

**Tailings facility status:** Inactive

The Tom Price – TSF2A tailings facility is managed under the Rio Tinto Group Safety Standard for the Management of Tailings and Water Storage Facilities, which is focused on ensuring safe operation of all our tailings facilities.

The implementation of the GISTM for the Tom Price – TSF2A tailings facility is almost complete, however there is further work required before full conformance with GISTM is reached. The only remaining action is to undertake additional assessment of groundwater impacts arising from the tailings facility. This work will be delivered as part of a closure study scheduled for 2024.

With safety and transparency being core principles for Rio Tinto and the GISTM, we have engaged with local representatives, including the Prescribed Body Corporate who represents the local Traditional Owner group, and emergency response personnel for the community of Tom Price. We will continue to share relevant information and seek inputs as engagement continues throughout the lifecycle of the tailings facility. We have an Emergency Preparedness and Response Plan in place, developed with involvement from local responders and community stakeholders.
1. Description of the tailings facility

Rio Tinto's Tom Price Mine is located approximately 5 km south-east of Tom Price town in the Pilbara region of Western Australia. The site comprises of two process plants: the Low-Grade Plant and the High-Grade Plant. The Low-Grade Plant divides the produced tailings into two different streams, coarse and fine tailings, which are deposited separately into the site’s tailings facilities. The fine tailings are flocculated, thickened and pumped to the Tom Price – TSF2A tailings facility.

Tom Price – TSF2A is a valley storage facility comprising of two cells with a combined footprint of approximately 148 ha. Tom Price – TSF2A was originally constructed as a single cell facility in 1992 and has been raised in two stages as summarised below.

The Tom Price – TSF2A tailings facility was originally constructed with a cross-valley main embankment with a maximum height of 35 m, and four saddle embankments. The original tailings deposition formed a decant pond against the main embankment to transfer water via the decant tower to the return water pond. From there, the return water was pumped back to the process plant. A change in the deposition practice occurred in approximately 2012, which resulted in the decommissioning of the original decant tower and commissioning of new pumps away from the main embankment due to the pond being relocated.

Tom Price – TSF2A was subsequently split into two cells (Northern Cell and Southern Cell) in 2014-15 through construction of a daywall (dividing wall). At the same time, the Northern Cell saddle dams were raised by upstream method. At this point, the pond was relocated within the Northern Cell and water returned to the plant using a mobile pump.

The main embankment and the perimeter access road were raised to the final design height of 36.5 m in 2017-18. Two new saddle dams, Saddle Dam 2B and Saddle Dam 3, were also constructed at that time. The decant pond is now located in the Southern Cell, and water is returned to the plant using a mobile pump.
2. Consequence classification

Credible failure modes for Tom Price – TSF2A have been identified and modelling has been undertaken of downstream flooding resulting from potential dam break scenarios at selected locations on the embankments of the tailings facility. The dam failure consequence classification was assessed in accordance with the GISTM Consequence Classification Matrix, and incremental losses linked to potential population at risk and potential loss of life; environment; health, social and cultural; and infrastructure and economics were considered.

The overall GISTM consequence classification for Tom Price – TSF2A is ‘Very High’, due to the proximity of the Tom Price light industrial area and potential impacts in terms of health, social, cultural heritage and cultural assets, environment, infrastructure and local economic impacts in the event of a tailings facility failure.

3. Risk assessment summary

Rio Tinto assesses risks in a manner consistent with the International Standards Organisation’s Risk Management – Guidelines (ISO 31000) using the Rio Tinto Risk Management Standard. Assessments of risks relevant to Tom Price – TSF2A are undertaken by a multi-disciplinary team. Risks are evaluated with regard to the potential consequences related to a range of aspects including, but not limited to, health and safety, social, environment, infrastructure and local economics. The material risks that have been identified for Tom Price – TSF2A and their associated control measures are summarised in the table below.

<table>

Material risks are reviewed on a quarterly basis and all other risks are reviewed annually by a multi-disciplinary team. The risk assessments are updated to reflect the current state of the risks and to ensure the control measures remain relevant and effective. The risk assessments are reviewed by the Independent Tailings Review Board.

A detailed study of tailings related risks and risk reduction measures was completed in May 2023 to ensure that the risks associated with Tom Price – TSF2A are effectively managed to a level that is as low as reasonably practicable (ALARP), and to ensure that all reasonable steps have been taken to reduce both the likelihood and consequences of a tailings facility failure.
4. Impact assessment summary

An impact assessment has been undertaken for Tom Price – TSF2A using credible flow failure scenarios. Human exposure and vulnerability have been assessed using the information from the dam break study to identify areas where people are likely to be exposed and vulnerable downstream during credible failure scenarios and the impact this may have on the social, environmental and local economic context.

In alignment with the United Nations Guiding Principles on Business and Human Rights and Rio Tinto’s Human Rights Policy, a human rights risk self-assessment tool was used to identify and address potential impacts from a facility failure at Tom Price – TSF2A to people’s rights, particularly those linked to community health, safety and wellbeing, Indigenous Peoples rights, and workplace health and safety, together with land access and use, labour rights, inclusion and diversity, and climate change. The assessment for the local community identified potential impacts to cultural heritage, the environment, livelihoods, land access and use, infrastructure and housing. The assessment, together with stakeholder mapping, has informed mitigation controls and engagement planning.

Potential environmental impacts from inundation following a dam failure on water quality, sensitive terrestrial and aquatic ecosystems, threatened species, and designated areas of conservation significance have been identified and assessed for Tom Price – TSF2A. The size of affected areas and the likely length of time required for remediation and recovery have been considered when determining the dam failure consequence classification.

The size of areas that may be affected and the likely length of time required for remediation and recovery have been considered when determining the dam failure consequence classification for Tom Price – TSF2A.

The information gathered from the dam break studies, social studies and assessments has been provided to the Local Emergency Management Committee (LEMC) as the local emergency response service. The LEMC includes representatives from regional council Shire of Ashburton, WA Police Force, Department of Fire and Emergency Services, St John Ambulance, State Emergency Services, the Department of Health and other government agencies, and industry and community representatives. The LEMC has had input into the development of the Emergency Preparedness and Response Plan for the tailings facility, which forms part of the overarching emergency preparedness and response for the site.

5. Description of the tailings facility design

Tom Price – TSF2A is a valley storage facility comprising two cells with a combined footprint of approximately 148 ha. The tailings facility was originally designed and constructed with a cross-valley main embankment and four saddle embankments, with the main embankment constructed a maximum height of 35 m. The embankments were constructed from locally sourced fill borrowed from within the footprint of the tailings facility and in close proximity of the site. The main embankment was constructed with an outer shell of borrow materials comprising clayey gravels and weathered rock and an inner core of finer, lower permeability material. A blanket drain is located in the downstream section.

The original tailings deposition formed a decant pond against the main embankment to allow the transfer of water via the decant tower to the return water pond. From there, the return water was pumped back to the process plant. A change in deposition practice occurred in approximately 2012, which comprised decommissioning the original decant tower and commissioning new pumps away from the main embankment.

Tom Price – TSF2A was subsequently split into two cells, the Northern Cell and the Southern Cell, in 2014-15 through construction of the daywall. At the same time, the Northern Cell saddle dams were raised by upstream method. At this point, the pond was relocated against the daywall within the Northern Cell and water returned using a mobile pump.

The main embankment and perimeter access road were raised to the final design height of 36.5 m in 2017-18. Two new saddle dams, Saddle Dam 2B and Saddle Dam 3, were also constructed at that time. The Main Embankment was raised using a modified centreline method, partially from rocky material on the
downstream slope to allow the raise to be constructed from the existing berm, and with general fill above the existing embankment crest. A transition zone was included between the general fill and rocky fill. The original lower decant was decommissioned as part of the Southern Cell raise works. The upper decant was decommissioned in May 2021. The decant pond is now located within the Southern Cell, and water is returned to the plant using a mobile pump.

The ultimate design for TSF2A allows for the storage of approximately 26.5 Mm³ of tailings, with the embankments at their current, final height of (maximum) 36.5 m above natural ground level.

6. Review findings summary

The current material findings from independent reviews and their associated control measures are summarised in the table below.

<table>
<thead>
<tr>
<th>Material review finding</th>
<th>Control measure(s)</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clearly document persistent tailings surface cracking to inform future reviews and audits and a long-term solution is included in the closure study.</td>
<td>To be included in the Operations, Maintenance and Surveillance (OMS) Manual.</td>
<td>Completed as part of normal operations, per the operations manual.</td>
</tr>
<tr>
<td></td>
<td>To be determined as part of the upcoming Closure Pre-Feasibility Study (PFS).</td>
<td>Closure PFS commencing Q3 2023.</td>
</tr>
<tr>
<td>The planned groundwater assessment of the Eastern drainage line should include a geochemical assessment of the tailings interaction with water and subsurface materials, geotechnical drilling programme with additional piezometers to inform seepage conceptualisation. A root cause analysis of the seepage should be completed once additional information is available.</td>
<td>To be assessed as part of the upcoming Closure PFS study.</td>
<td>Closure PFS commencing Q3 2023.</td>
</tr>
<tr>
<td>Efforts to eradicate the Athel Pine trees is noted and it is recommended that, if not already completed, the lessons learned from individual sites are shared a programme developed for the eradication of Athel Pine.</td>
<td>Handling of the Athel Pine is an ongoing task carried out by the site Environmental team.</td>
<td>Environmental risks will be addressed through the closure studies with ongoing maintenance during operations.</td>
</tr>
<tr>
<td>Revise the Tom Price – TSF2A water balance to meet the GISTM requirements.</td>
<td>Further development of a water balance model.</td>
<td>Suitable water balance model in place, improvements planned in 2024.</td>
</tr>
</tbody>
</table>

An annual performance review is conducted by the Engineer of Record to review monitoring instrumentation and resultant data, and geotechnical and operational performance. The most recent annual performance review was undertaken in February 2023, which found that:
• Management and operation of Tom Price – TSF2A is in general accordance with the design intent;
• Tom Price – TSF2A is operated and managed in line with the appropriate DMIRS requirements and guidelines;
• Monitoring and daily tasks are generally carried out well, and staff display a noticeable concern and attention to detail when going about their tasks;
• No evidence of significant erosion, slumping or cracking was observed along the crest and slopes of Tom Price – TSF2A embankments during the inspection; and
• Erosion and large cracking on the tailings beach at Saddle Dam B and Saddle Dam C was found during the inspections. It was recommended that the cracks are backfilled and that inspections of the Northern Cell tailings beach area are undertaken regularly.

7. Environmental and social monitoring programmes

There are currently no material findings from the environmental and social monitoring programmes for Tom Price – TSF2A.

Monitoring programmes form part of Rio Tinto’s Health, Safety, Environment and Communities (HSEC) management system, that acts as the environmental social management system under the GISTM.

To support environmental monitoring works, groundwater bores around the periphery of Tom Price – TSF2A are monitored on a quarterly basis. Surface water monitoring is also carried out quarterly at the tailings facility seepage pond. Monitoring is carried out for standing water level, pH, electrical conductivity, alkalinity, major ions and selected metals in accordance with regulatory environmental requirements. These parameters are monitored as part of efforts designed to prevent the groundwater table adjacent to Tom Price – TSF2A rising to the surface. Groundwater levels and water quality met regulatory requirements in the 2022 annual reporting period.

Engagement has commenced with project affected people, Traditional Owners representatives, local responders and community stakeholders linked to Tom Price – TSF2A to increase awareness of the tailings facility and our approach to safe tailings facility management, to build an integrated knowledge base of the tailings facility and surrounds, and to collectively develop plans to monitor and maintain a shared state of readiness in the event of a tailings facility failure.

As monitoring programmes mature and engagement continues with local community, there will be more opportunity for stakeholders to be involved, request information, seek feedback and raise any concerns they may have.

8. Emergency preparedness and response

An Emergency Preparedness and Response Plan has been prepared for Tom Price – TSF2A as part of the overarching emergency preparedness and response planning for the community of Tom Price. The Emergency Preparedness and Response Plan is based on credible flow failure scenarios and the assessment of potential consequences to people and the environment, and identifies:
• Equipment and personnel resources (including the Tom Price Emergency Response Team) required to respond to a tailings facility emergency;
• The chain of command in the event of an actual or potential Tom Price – TSF2A failure;
• Roles and responsibilities of internal employees, responders and other relevant stakeholders;
• Personnel competencies and training needs for all responders;
• Training exercises that are required to be conducted;
• A graduated Trigger Action Response Plan, where actions are based on how imminent a failure may be, or where actions are based on a failure that has occurred;
• Proposed communications approach during an emergency;
• Evacuation decision making, co-ordination, and planning requirements; and
• Proposed recovery considerations following a Tom Price – TSF2A failure.

The Emergency Preparedness and Response Plan articulates roles and responsibilities in the event of a tailings facility failure and procedures that need to be followed to minimise harm to people and the environment, and has been developed in consultation with the Local Emergency Management Committee (LEMC). The LEMC is a requirement of State legislation and includes representatives from the Regional Council of the Shire of Ashburton, West Australian (WA) Police Force, the Department of Fire and
Emergency Services, St John Ambulance, State Emergency Services, the Department of Health, government agencies, industry and community representatives. The LEMC has a Local Disaster Management Plan, prepared on behalf of the Regional Council and activated in the event of a local emergency.

The Tom Price mining operation maintains the responsibility of evacuation orders within the mine site lease boundary. The LEMC has responsibility for advising the community when and how to evacuate, and the WA Police Force has overall responsibility of ordering a mandatory evacuation (for the mine site and/or the community).

In the event of a catastrophic tailings facility failure, a long-term recovery plan will be developed in partnership with the LEMC and other relevant stakeholders to ensure the considerations, response strategies and approach are appropriate for the local context and the failure event.

9. Independent review timing

The most recent independent operational reviews of Tom Price – TSF2A were conducted in February 2023 in alignment with the Q1 annual tailings facility review process. The review involved an annual performance review undertaken by the Engineer of Record for the tailings facility, and a Department of Mines, Industry Regulations and Safety (DMIRS) annual audit conducted by an independent third-party representative.

An Independent Tailings Review Board was conducted in October 2022. These reviews are conducted during the last quarter of each calendar year, with the next review scheduled for Q4 2023.

10. Financial capacity for closure

The Tom Price – TSF2A tailings facility is 100% owned by Rio Tinto. Rio Tinto confirms it has adequate financial capacity to cover the estimated costs of planned closure, early closure, reclamation, and post-closure monitoring and maintenance of Tom Price – TSF2A.
IMPORTANT NOTICE

Content of document

This document includes figures, classifications, assessments and other information regarding tailings and Rio Tinto’s systems. Some of the information provided relies upon judgment based on internal or external reviews of information. Unless otherwise stated the information in the document is based on data available as at August 2023, and judgments or assessments in the document may be based on data which predates August 2023. The information and views may change based on new or different information, circumstances or events and should not be relied upon as a forecast or recommendation.

Forward looking statements

The information presented contains forward-looking statements (within the meaning of the US Private Securities Litigation Reform Act of 1995) concerning the financial condition, operations and businesses of Rio Tinto. All statements other than statements of historical fact are, or may be deemed to be, forward-looking statements.

Forward-looking statements are statements of future expectations that are based on management’s current expectations and assumptions and involve known and unknown risks and uncertainties that could cause actual results, performance of, or events affecting Rio Tinto, or the industry, to differ materially from those expressed or implied in these statements. Such forward-looking statements involve subjective judgements and determinations based on available geological, technical, contractual and economic information. These could change because of new information from production or mining activities, or changes in economic factors, including changes in market prices and operating costs, changes in the regulatory policies of host governments, or other events. The statements could also be altered by acquisitions and divestments, new discoveries, and extensions or closure of existing mines, as well as the application of improved recovery and tailings techniques. Published statements could also be subject to correction due to errors in the application of internal assurance or published rules or guidance, and changes in that assurance, rules or guidance. Please also refer to further factors and risks as identified in Rio Tinto’s most recent Annual Report and Accounts in Australia and the United Kingdom and the most recent Annual Report on Form 2-0-F filed with the United States Securities and Exchange Commission (“SEC”) or Forms 6-K furnished to, or filed with, the SEC.

As such, readers should not place undue reliance on these forward-looking statements, including with regard to future investment decisions.

Rio Tinto undertakes no obligation to publicly update, or revise, any information in the document, including forward-looking statements, as a result of new information, future events or other information.
Appendix A:
Group-level tailings management information supporting the GISTM tailings facility disclosures

5 August 2023

Guidance on interpretation of this Appendix to the GISTM tailings facility disclosures:

The following provides Rio Tinto Group-level information relating to tailings management that supports the GISTM tailings facility disclosures. The processes implemented at individual sites may differ slightly from those described here.

The information provided in this Appendix to the Global Industry Standard on Tailings Management (GISTM) tailings facility disclosures should be read in conjunction with the information relating to Rio Tinto’s approach to tailings management that is available on the Rio Tinto website.

Where Rio Tinto considers a Rio Tinto internal process, standard, procedure and/or plan gives rise to a materially similar outcome to a requirement of GISTM, Rio Tinto has adopted the relevant defined term from GISTM for the purpose of reporting under Requirement 15.1.B of GISTM, even though the relevant Rio Tinto process may have a different name or achieve a materially similar outcome by different methods.

The information provided in this disclosure contains forward-looking statements (within the meaning of the US Private Securities Litigation Reform Act of 1995) concerning the financial condition, operations and businesses of Rio Tinto. All statements other than statements of historical fact are, or may be deemed to be, forward-looking statements.

Readers should not place undue reliance on these forward-looking statements, including with regard to future investment decisions. This is because forward-looking statements are statements of future expectations that are based on management’s current expectations and assumptions and involve known and unknown risks and uncertainties that could cause actual results, performance of, or events affecting Rio Tinto, or the industry, to differ materially from those expressed or implied in these statements.

Refer to the end of this Appendix to the GISTM tailings facility disclosures for further information on the content of this document and on forward-looking statements.
Appendix A: Group-level tailings management information supporting the GISTM tailings facility disclosures

A.1. Rio Tinto’s tailings facilities

Key points:
- Information for the tailings facilities that Rio Tinto operates are included in our interactive tailings disclosure map.
- New tailings facilities at our operations are in various stages of studies and construction; these will be added to the interactive tailings disclosure map over time.
- Rio Tinto also has an interest in tailings facilities at non-managed and non-operated sites.

Rio Tinto operates a diverse portfolio of tailings facilities at various stages of the tailings facility lifecycle, including tailings contained within engineered earthen embankments and tailings deposited into previously mined open pits. Some tailings facilities consist of embankments constructed in a single phase; others have been raised several times over their active life to increase tailings storage capacity.

For each of our tailings facilities with ‘Very High’ and ‘Extreme’ GISTM consequence classifications, we have published a tailings facility disclosure statement under Principle 15 of the GISTM that provides information on implementation status. In addition, the tailings information published in response to the request for public disclosure on tailings by the Investor Mining and Tailings Safety Initiative (IMTSI) is available for these facilities. For the remaining tailings facilities with ‘Low’, ‘Significant’ and ‘High’ GISTM consequence classifications, we have published information in the IMTSI disclosure; disclosure statements under Principle 15 of GISTM will be available for all Rio Tinto operated tailings facilities by August 2025.

We periodically update the list of tailings facilities to reflect operational and ownership changes, including changes relating to closure or remediation obligations for legacy assets and reclassification of tailing facilities as these develop over the life of operations.

Rio Tinto also has an interest in other mining operations through joint ventures and other business entities, and through our connection to legacy assets. Sites with tailings facilities in which Rio Tinto has an interest include: Alumar, Blackbird, Escondida, Gladstone Power Station, Mineração Rio do Norte, Olette, Ranger, and Saint Cyr. Refer to the operator or owner for further information on these tailings facilities.

A.2. Consequence classification

Key points:
- Each tailings facility has been assessed against the five potential loss categories defined in the GISTM and assigned a dam failure consequence classification based on the highest consequence classification across the five categories.
- Consequence classifications for Rio Tinto’s tailings facilities are a result of assessment by qualified and experienced multi-disciplinary teams following consideration of credible failure modes and impact assessments.
- Consequence classifications can change over time.

Annex 2 of the GISTM includes the Consequence Classification Matrix, as shown below. Using this matrix, potential failures of a tailings facility are assessed against five potential loss categories and assigned a dam failure consequence classification. The overall GISTM consequence classification for a tailings facility is the highest classification across the five categories.

It is important to note that consequence classifications are not ratings of the safety condition of a tailings facility or the likelihood of failure; instead, they rate the potential consequence if the tailings facility were to fail.
Appendix A: Group-level tailings management information

<table>
<thead>

<td>5,000–10,000 people affected by disruption of business, services or social disruption.</td>
<td>Extreme economic losses affecting critical infrastructure or services (e.g., hospitals, industrial facilities, storage facilities for dangerous substances), severe risk to community. - US$500M</td>
</tr>
</tbody>
</table>

From August 2023, Rio Tinto has assigned a GISTM consequence classification to each tailings facility that we operate following assessment of credible failure modes, impact assessments and consideration of downstream conditions. These assessments are conducted by multi-disciplinary teams and use in-house and external expertise. The current GISTM consequence classification for each tailings facility is shown in our interactive tailings disclosure map and in our IMTSI tailings disclosure.

There are other consequence classification schemes in use for tailings facilities, and Rio Tinto has previously published the consequence classifications for our tailings facilities based on the relevant local or international scheme. There may be differences in classification ratings between schemes, depending on the criteria used to assign the classifications.

The consequence classification of a tailings facility can change over time for various reasons, including changes to the operational status of the tailings facility, additional construction that changes the configuration of the tailings facility, the completion of engineering works or implementation of other controls that reduce the potential consequences, or when new information is obtained about the tailings facility, or about the social, environmental and local economic context where the tailings facility is situated.

Consequently, Rio Tinto may, from time to time, amend the consequence classification of a tailings facility. Given the nature of the work required to assess if an amendment to a consequence classification is required, there may be a delay between the amendment being assessed and the consequence classification in our GISTM and IMTSI disclosures and in our interactive tailings disclosure map.

A.3. Risk assessments

**Key points:**
- Rio Tinto’s Risk Management Standard describes our approach to identifying, assessing, managing and mitigating risk.
- Tailings risk assessments consider risk scenarios based on credible failure modes.
- Risk assessments are conducted by qualified and experienced multi-disciplinary teams.
- Identified risks are managed using the 'three lines of defence' model.
All of Rio Tinto’s tailings facilities have undergone a detailed risk assessment in alignment with Rio Tinto’s Risk Management Standard and, where relevant, following our internal guidance on risk analysis for dam safety. Using these processes, potential risk scenarios are listed, risk controls and their effectiveness are assessed, and additional controls are identified. The outcome of these risk assessments is a risk classification using Rio Tinto’s internal risk classification scheme which determines the materiality of the risks and the approach to mitigating them.

For tailings facilities, the risk analysis is based on credible failure modes. While credible failure modes are possible ways that a tailings facility could fail, the GISTM notes that “credible catastrophic failure modes do not exist for all tailings facilities” and “the term ‘credible failure mode’ is not associated with a probability of this event occurring and having credible failure modes is not a reflection of facility safety”.

Credible failure modes can vary over the lifecycle of a tailings facility as the operating conditions change; the risk assessment process takes into account these changes, and risk assessments can be done at different stages in the life cycle (for example, a risk assessment will occur for the operating phase of the tailings facility and will subsequently be reviewed and updated when the tailings facility moves into the closure phase).

Tailings facility risk assessments are conducted by multi-disciplinary teams to consider the potential causes and impacts of a tailings facility failure including to communities and the environment. Rio Tinto has qualified and experienced personnel who participate in these risk assessments, and we also use the expertise and knowledge of external consultants at various times to contribute to and review the outcomes.

We have a structured approach to managing risks associated with tailings facilities, underpinned by our Group Safety Standard for the Management of Tailings and Water Storage Facilities. We apply the ‘three lines of defence’ model to assurance activities to ensure risks are appropriately managed, through:

- First line assurance, facilitated at the site level, with the purpose of assuring effective tailings facility design, comprehensive operational controls and regular independent reviews;
- Second line assurance through Business Conformance Audits and Technical Risk Reviews; and
- Third line assurance that is independent and is commissioned by the Executive and Board to ensure that our systems for risk management, internal control and governance are adequate and effective.

A.4. Impact assessment, and human exposure and vulnerability

Key points:
- Impact assessments have been used to inform and identify potential environmental impacts, and potential human exposure and vulnerability to a tailings facility failure.
- Human exposure and vulnerability assessments are used to inform the social impact assessments and other social studies that consider social, environmental and local economic contexts relevant to the tailings facility.
- A human rights risk self-assessment was used to identify, assess, manage and mitigate any potential impacts to project-affected people’s salient human rights, in alignment with the United Nations Guiding Principles on Business and Human Rights and Rio Tinto’s Human Rights Policy.

Rio Tinto’s environment Group Standards outline the minimum performance requirements for the management of water quality, air quality, mineral waste (including tailings), land disturbance and rehabilitation, hazardous materials and non-mineral waste as well as biodiversity and natural resource management. Our Health, Safety, Environment and Communities management system ensures that our environment standards are considered collectively with health, safety, and social performance standards as part of the hazard identification and risk management process to identify and control risks associated with business activities.

Regulations in the jurisdictions where we operate require Rio Tinto to conduct environmental impact assessments (EIAs) or social and environmental impact assessments (SEIAs) as part of any new mine development and, where required, expansions to existing operations. Additionally, risk assessments are required to be undertaken to consider climate change considerations, water management and any hazards associated with physiochemical properties and biogeochemistry of tailings. To understand the potential risks associated with climate change affecting the stability of tailings facilities, assessments have been undertaken
in line with Rio Tinto’s approach to climate risk and resilience assessment for new, operating and closed tailings facilities.

Environmental baseline information and supporting monitoring information for each tailings facility has been incorporated into the integrated knowledge base. Additional environmental assessments have been undertaken as required to supplement the knowledge base to support tailings management risk mitigation approaches.

Rio Tinto’s Communities and Social Performance Standard defines minimum, mandatory performance and management criteria to manage social and human rights risks and opportunities associated with our business activities that could materially impact host communities, other stakeholders with whom we interact, or the Rio Tinto Group.

To assess potential human exposure, and vulnerability, together with social risks and impacts from a tailings facility failure, assessments have been conducted in alignment with international standards, guidelines and best practice approaches, linked to:

- Social knowledge base, community baselines, socio-economic data and local context considerations;
- Social risks resulting from a potential tailings facility failure being considered through the formal, multidisciplinary risk assessment process using Rio Tinto’s risk evaluation framework to quantify the potential consequences to people, health and safety, human rights, license to operate, the environment, business integrity, and legal and regulatory compliance;
- Human exposure and vulnerability assessments conducted for each tailings facility to identify inherent and induced vulnerabilities from a failure scenario identified in the dam break study;
- Social impact assessments being updated to reflect current social contexts, baselines, stakeholders, impacts, dependencies, mitigations and opportunities; and
- In alignment with the United Nations Guiding Principles on Business and Human Rights and Rio Tinto’s Human Rights Policy, a targeted human rights risk self-assessment tool was used to consider and manage salient human rights risks resulting from tailings facility failure. The tool provides a framework for identifying, assessing, mitigating, managing and monitoring human rights risks in alignment with Rio Tinto’s Risk Management Standard and Communities and Social Performance Standard.

A.5. Tailings facility design

Key points:
- The design of each tailings facility is unique, based on the type of tailings and the location in which the tailings facility is situated.
- Our tailings facilities are designed and reviewed by qualified and experienced consultants.
- Designs are undertaken to industry standards and leading practice.

Tailings storage is a substantial design decision when developing a mine, and there are many factors that need to be considered in selecting the site and construction method to safely contain the tailings. Site conditions such as topography, foundation conditions, rainfall, seismic activity, mineral characteristics and proximity to people and communities dictate appropriate siting of tailings facility locations, technology and storage solutions.

As a result, each tailings facility is unique. Depending on the environment and the chemical characteristics of the tailings, the tailings facility may be lined, using a variety of lining systems which are designed to prevent impacts to surface and groundwater systems.

In other cases lining may not be required and storage behind an engineered earthen embankment or within a mined-out open pit may be sufficient. Back-filling of mined-out pits may have advantages for overall risk reduction and will generally be considered as an option for tailings storage where practicable. As the tailings slurry is collected in the tailings facility, the water separates from the heavier sand and silt particles and is collected at the surface. The water in the tailings facility may then be recycled back to the process plant for reuse to minimise the impacts to the environment.

In addition to the design requirements specified by the GISTM, our Group Safety Standard for the Management of Tailings and Water Storage Facilities has specific requirements relating to the design of tailings facilities. The design of our tailings facilities is carried out to industry accepted design standards and
design criteria by qualified and experienced personnel employed by engineering consulting companies. The
designs are also reviewed by independent tailings facility specialists. For our ‘Very High’ or ‘Extreme’
consequence classification tailings facilities, oversight and review of the technical aspects of the design is
within the remit of the Independent Tailings Review Board.

A.6. Annual performance reviews and dam safety reviews

Key points:
• Annual performance reviews are undertaken by the Engineer of Record, and findings are reported back
to Rio Tinto.
• Dam Safety Reviews comprise independent reviews conducted in alignment with our Group Safety
Standard for the Management of Tailings and Water Storage Facilities, together with reviews of our As
Low As Reasonably Practicable (ALARP) risk assessments.
• ALARP demonstration is an ongoing process for the lifecycle of the tailings facility and is a driver for
improvements to the management of our tailings facilities.

Supporting the performance requirements specified by the GISTM, the Rio Tinto Group Safety Standard for
the Management of Tailings and Water Storage Facilities has specific requirements relating to monitoring
and design verification. The key requirements are:
• All personnel conducting monitoring, survey and other design verifications must be suitably trained and
familiar with the tailings facility performance objectives;
• Reports must be prepared that outline tailings facility performance at specified intervals;
• The Engineer of Record must inspect the tailings facility at least annually and review the operational
documentation to confirm that operation of the tailings facility conforms to the intent of the design; and
• Monitoring reports must be reviewed by the Engineer of Record and must confirm that the tailings facility
is operating within the design constraints.

To meet these requirements, an annual performance review is undertaken by the Engineer of Record to
assess performance of the operation to design, and a review report is then provided to Rio Tinto.

Rio Tinto addresses the GISTM requirements of a Dam Safety Review by undertaking independent reviews
and risk analyses processes to demonstrate that risks have been reduced, including to an As Low as
Reasonably Practicable (ALARP) level where required.

Design reviews are conducted at various stages of the design process. The independent design review
includes detailed technical review of all aspects of the design with emphasis on the design basis analysis
including site and material characterisations, water balance, and stability modelling.

The life-of-facility design is reviewed by an independent tailings facility specialist prior to the implementation
of the design. Each detailed stage design, including final closure design, is also reviewed by an independent
tailings facility specialist prior to start of construction. The independent specialist evaluates the technical
aspects of the design including construction drawings and technical specifications and ensures that the
stage designs align with the life-of-facility design.

Independent operational reviews are planned for and completed through the tailings facility lifecycle,
including closure and post-closure phases, to identify physical hazards associated with geotechnical,
hydrological, hydrogeological and performance aspects of the tailings facility. Reviews are conducted at a
frequency of not less than once every two years. Following implementation of the GISTM for a tailings
facility, the independent reviewer will make a statement on the safety of the tailings facility, in accordance
with the requirements of the GISTM.

ALARP demonstration is undertaken predominantly through a formalised quantitative risk assessment
process. ALARP demonstration activities are documented, including actions and timing for completion, and
associated commentary is provided on the rationale behind the design decisions. We then subsequently
confirm that all actions have been implemented to mitigate risks.

The Engineer of Record reviews the ALARP assessment results, followed by an additional review by the
Independent Tailings Review Board or senior independent technical reviewer. The Accountable Executive
may then take the decision to confirm that the tailings facility is at ALARP level, or direct further works to be undertaken to demonstrate ALARP.

ALARP demonstration is not a one-off event; it is an iterative process through the tailings facility lifecycle, including closure. The Rio Tinto processes listed above align with the GISTM ALARP requirements to:
- Conduct and update risk assessments with a qualified multi-disciplinary team using best practice methodologies at a minimum every three years and more frequently whenever there is a material change either to the tailings facility or to the social, environmental and local economic context; and
- Conduct a review of ALARP at the time of every Dam Safety Review or at least every five years for an existing tailings facility classified as ‘High’, ‘Very High’ or ‘Extreme’.

A.7. Environmental and social monitoring

Key points:

- **Effective and integrated management of the tailings facility is governed through an Environmental and Social Management System (ESMS).**
- The business monitors local communities, in terms of social contexts, impacts, dependencies, public perceptions, trust and acceptance, feedback, complaints and grievances through the collection and analysis of data to inform decision making.
- Social monitoring programs are maturing as local communities become more aware and engaged in the management of tailings facilities. Engagement plans are in place to support ongoing local engagement throughout the tailings facility lifecycle and to raise awareness and maintain a shared state of preparedness in the event of tailings facility failure.
- There are opportunities for local communities to become more involved in environmental monitoring activities linked to tailings management.

Rio Tinto’s Health, Safety, Environment and Communities (HSEC) management system is reflective of the ‘plan, do, check, act’ concept that integrates procedures and objectives to manage environmental and social risks and impacts in a structured and meaningful way. The HSEC system meets the requirements of the environmental social management system (ESMS) under GISTM, in that it promotes sustainable environmental and social performance, reflects clearly defined and repeatable processes, is dynamic, promotes continuous improvements and is integrated with other management systems, including the tailings management system.

Environmental and social monitoring activities are in place to support the management system.

Environmental monitoring programs are established based on environmental impact assessments to determine actual and potential impacts from mining projects, which are compared against predicted or modelled impacts as part of the assessment process.

As part of the environmental impact assessment process, Rio Tinto is also required to undertake monitoring of impacts to the receiving environment to satisfy conditions and commitments outlined in statutory approvals and to conform to the requirements of our environment standards.

Monitoring can include, but is not limited to, assessment of impacts of the tailings facility to local and/or regional groundwater quality, surface water quality and local air quality. In most jurisdictions, reporting of environmental performance is through provision of monitoring results to the local regulators, as well as nominated affected stakeholders, and is required on at least an annual basis for the life of the tailings facility, including the closure and post-closure phases.

Our approach to social monitoring involves the collection and monitoring of data linked to socio-economic contexts of local communities, risk and impact assessments, stakeholder feedback, community perception surveys, complaints and grievances, and requests for information. The information gathered is used to manage social risks and impacts, measure performance against targets, and to inform decision making.

Engagement with local communities is used to increase awareness of each tailings facility and our approach to safe tailings management, to build an integrated knowledge base for each tailings facility and local surroundings, collectively develop plans to monitor performance, and to support a maintained shared state of preparedness in the event of a tailings facility failure. A variety of engagement tools and resources have
been developed to support community forums, town drop-in centres, tailings facility site visits and round table discussions with stakeholders, including the use of interactive maps and explainer videos as needed.

With safety and transparency being core principles for Rio Tinto and the GISTM, we have engaged with local communities about the ‘Very High’ and ‘Extreme’ consequence tailings facilities located in the areas where we operate and we will continue to share relevant information, seek input and ensure communities are prepared in the unlikely event of a failure.

Community grievances are managed through a mechanism that outlines processes for obtaining, handling, responding to, and remedying complaints and grievances. Our Communities and Social Performance Standard requires that each site has a mechanism that has been designed in consultation with communities and stakeholders, is publicly available, easily accessible, and allows for an appeal process for resolution of complex complaints or grievances.

To date, there have been a small number of reported complaints and requests for additional information in relation to tailings management from local communities across our global footprint. The complaints have been managed in accordance with our internal standards and procedures and responses provided to stakeholders as appropriate. As engagement continues, local communities will have more opportunity to raise questions, seek clarification, express concerns and request information.

### A.8. Emergency preparedness and response

**Key points:**
- **Rio Tinto has a well-established Business Resilience and Recovery Programme, which applies to all emergency situations including tailings-related events.**
- **Immediate emergency response is provided by our emergency response teams, in collaboration with local emergency response groups as required.**
- **We engage with local communities and agencies on emergency response planning and considerations for longer-term recovery.**

Principles 13 and 14 of the GISTM include the requirement for a site-specific tailings facility Emergency Preparedness and Response Plan which includes specific actions to both prepare for and manage an escalating event, and deliver long-term business, social and environmental recovery following a catastrophic failure.

The Business Resilience and Recovery Programme (BRRP) is Rio Tinto’s emergency and crisis management framework, ensuring enterprise-wide preparedness to respond to actual and potential incidents and/or events that may impact local communities, the environment, or our business objectives.

Our sites leverage the BRRP framework to address the GISTM requirements. Each site has an emergency response team that acts as first responders to any emergency on site. These teams are trained in rescue, medical aid and evacuations, and regularly practice emergency response scenarios. The role of the public sector or civil emergency response would be significant in the event of a catastrophic tailings facility failure, with their role likely to extend to the assumption of overall incident command in accordance with legislative requirements. In this situation, the site will comply with the directions of the lead response agency and cooperate with their response efforts.

In alignment with the BRRP and to meet the requirements of the GISTM for an Emergency Preparedness and Response Plan, a Tailings Response Plan has been prepared for each tailings facility as part of the overall emergency preparedness and response planning for local communities. The Tailings Response Plan is based on credible flow failure scenarios and the assessment of potential consequences. The plan includes details on roles and responsibilities, chain of command, training competencies, action responses, evacuation procedures and considerations for recovery.

To prepare for long term recovery in the event of a tailings facility failure, we will engage with public sector agencies and other organisations to consider social and environmental response strategies that may be relevant to reconstruction, restoration and recovery activities, tailored to the failure scenario and local context. In the event of a failure, a long-term recovery plan would then be developed and implemented in partnership with all relevant stakeholders supporting the recovery efforts.
A.9. Frequency of independent reviews

Key points:
- Independent reviews of tailings facility designs are conducted at key stages of the design phase for each of our tailings facilities.
- Independent reviews of tailings facility operation are conducted at a frequency of not less than once every two years.
- Rio Tinto has a process for appointing Independent Tailings Review Boards for tailings facilities with ‘Very High’ and ‘Extreme’ consequence classifications.

As detailed in Section A.6, the independent reviews undertaken by Rio Tinto include reviews of tailings facility designs, and reviews of tailings facility operation. Independent design reviews will be conducted as required at multiple stages of the design process as it progresses and typically occur at each project stage through pre-feasibility, feasibility, and other check points of the detailed design phase. Independent operational reviews, where an assessment on the performance of the tailings facility is conducted, are conducted at a frequency of not less than once every two years.

In addition to these independent reviews, Rio Tinto undertakes Independent Tailings Review Board reviews for tailings facilities with a GISTM consequence classification of ‘Very High’ and ‘Extreme’. The Independent Tailings Review Board’s role is to provide the Accountable Executive and senior management with independent, objective, expert advice in identifying, understanding, and managing the risks and opportunities associated with the relevant tailings facility. The Independent Tailings Review Board procedures require:
- A minimum of three members to constitute the board;
- Additional members to be appointed depending upon the risks associated with, and the complexity of, the tailings facility; and
- A minimum of two internationally recognised expert board members who are independent and external to the business.

A.10. Financial capacity for closure

Key points:
- Rio Tinto has processes in place for estimating closure costs.
- Closure provisions for close-down, restoration and environmental obligations are included in the financial statements described in Rio Tinto’s Annual Report.
- Rio Tinto’s financial statements are audited by an independent auditor.

The financial provisions and estimated closure costs for sites are included in Rio Tinto’s consolidated financial statements in Rio Tinto’s Annual Report. A copy of the latest Annual Report can be downloaded from Rio Tinto’s website.

The financial provisions for close-down and restoration costs include the dismantling and demolition of infrastructure, the removal of residual materials, and the remediation of disturbed areas for mines and refineries and smelters. The provision excludes the impact of future disturbance which is planned to occur during the life of mine, so that it represents only incurred disturbance as at the balance sheet date.

Close-down and restoration costs are a normal consequence of mining or production, and the majority of close-down and restoration expenditure is incurred in the years following closure of the mine, refinery or smelter. Although the ultimate cost to be incurred is uncertain, the Group’s businesses estimate their costs using current restoration standards, techniques and expected climate conditions. The costs are estimated on the basis of a closure plan and are reviewed at each reporting period during the life of the operation to reflect known developments. The estimates are also subject to formal review, with appropriate external support, at regular intervals.

We use our judgment and experience to determine the potential scope of closure rehabilitation work required to meet the Group’s legal, statutory and constructive obligations, and any other commitments made to stakeholders, and the options and techniques available to meet those obligations and estimate the associated costs and the likely timing of those costs. Further details can be found under the heading ‘Provision for closure costs’ in the Financial Review section of the Annual Report.
The financial statements included in the Annual Report are audited by an independent auditor who provides an opinion that the financial statements give a true and fair view of the state of Rio Tinto’s affairs, and that the statements have been properly prepared in accordance with international accounting standards. Evaluation of specific provisions for close-down, restoration and environmental obligations (‘closure provisions’) at certain sites is a recurring Key Audit Matter (KAM) noted in the independent auditors’ report. For further information, refer to the Independent Auditor’s Reports section of the Annual Report.
IMPORTANT NOTICE

Content of document

This document includes figures, classifications, assessments and other information regarding tailings and Rio Tinto’s systems. Some of the information provided relies upon judgment based on internal or external reviews of information. Unless otherwise stated the information in the document is based on data available as at 5 August 2023, and judgments or assessments in the document may be based on data which predates 5 August 2023. The information and views may change based on new or different information, circumstances or events and should not be relied upon as a forecast or recommendation.

Forward looking statements

The information presented contains forward-looking statements (within the meaning of the US Private Securities Litigation Reform Act of 1995) concerning the financial condition, operations and businesses of Rio Tinto. All statements other than statements of historical fact are, or may be deemed to be, forward-looking statements.

Forward-looking statements are statements of future expectations that are based on management’s current expectations and assumptions and involve known and unknown risks and uncertainties that could cause actual results, performance of, or events affecting Rio Tinto, or the industry, to differ materially from those expressed or implied in these statements. Such forward-looking statements involve subjective judgements and determinations based on available geological, technical, contractual and economic information. These could change because of new information from production or mining activities, or changes in economic factors, including changes in market prices and operating costs, changes in the regulatory policies of host governments, or other events. The statements could also be altered by acquisitions and divestments, new discoveries, and extensions or closure of existing mines, as well as the application of improved recovery and tailings techniques. Published statements could also be subject to correction due to errors in the application of internal assurance or published rules or guidance, and changes in that assurance, rules or guidance. Please also refer to further factors and risks as identified in Rio Tinto’s most recent Annual Report and Accounts in Australia and the United Kingdom and the most recent Annual Report on Form 2-0-F filed with the United States Securities and Exchange Commission (“SEC”) or Forms 6-K furnished to, or filed with, the SEC.

As such, readers should not place undue reliance on these forward-looking statements, including with regard to future investment decisions.

Rio Tinto undertakes no obligation to publicly update, or revise, any information in the document, including forward-looking statements, as a result of new information, future events or other information.
